
How interest rates move the Polish Banking Sector

Data Analyst: Szymon Rosiński

Client/Sponsor: Investors focused on the banking sector in Poland

Style: Policy style brief

Purpose:

Analyse how changes in interest rates dictated by the Polish Central Bank impact banking trends and growth. Analysis in 3 scenarios focusing on the DDM method ending with investor oriented suggestions about the Banking market itself.

Scope / Major Project Activities:

Activity	Description
Gather essential info about banks which would be representative of the sector	Collect key data focusing on IFRS reports and stock price changes from the past 5 years. Add macroeconomic context and further refine the scope
Clean and analyse data using Excel modelling	Spread historical financials collected earlier. Build three NBP rate scenarios (hike, base, cut). Project dividends for each scenario
Modelling and crosscheck	Use DDM for all 3 scenarios. Double check calculations and crosscheck with external datasets and predictions
present findings in an appealing and easy to digest form	Create a short memo and stakeholder presentation focusing on key findings and recommendations. Package in a ready to ship format

This project does not include:

- Overall analysis of the banking sector in Poland

- Correlation analysis between political decisions and those made by the NBP
- How project's findings affect regular consumers

Deliverables:

Deliverable	Description/ Details
Investor memo (policy-style brief)	Short written brief for investors in the Polish banking sector. Fair value of mBank and Bank Pekao under three NBP reference-rate scenarios, what the rate path is worth in value terms, what today's share price implies about long-run profitability, and how the model compares with the published analyst consensus.
Stakeholder presentation	Slide deck covering the same findings in a form that can be presented: the answer first, the valuation and its uncertainty, the rate channel, the sector read-across, the limitations and the recommendation. Speaker notes included.
Valuation model (Excel)	Working file behind both of the above: five years of historical financials reconciled to the audited statements, three NBP rate paths, DDM and Excess Return valuations, a six-bank peer comparison normalised for FX-mortgage legal costs, and sensitivity grids. Built-in consistency checks that must read zero.
Methodology and source register	Documentation of every judgement call with its rejected alternative and measured cost, a source for each entered figure, and a register of traps found in the source data.

Schedule Overview / Major Milestones:

Milestone	Expected Completion Date	Description/Details
<i>Finish refining the scope and gather all essential data</i>	<i>30.07.26</i>	<i>Collect all necessary data needed to accomplish project goals. Prepare Excel sheets for clean and proper documentation.</i>

<i>Properly Clean and process data. Prepare for the valuation phase</i>	<i>13.08.26</i>	<i>Use Excel to comprehensively clean and prepare data for valuation. Flag any inconsistencies or unexpected data trends</i>
<i>Complete extensive valuation</i>	<i>27.08.26</i>	<i>Finish all 3 analyses complete with double checking and comparing results to external sources</i>
<i>Create visualisations of the results and fully ship the project</i>	<i>14.09.26</i>	<i>Construct a presentation and an investor memo showcasing project findings</i>

[Estimated date for completion: 14.09.2026](#)

Provided there are no major setbacks or roadblocks.
